

Civil Wars

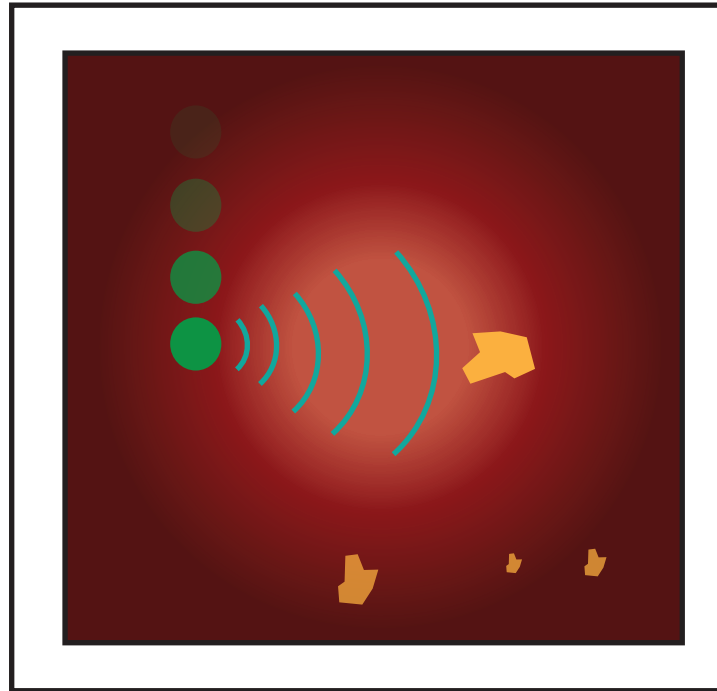

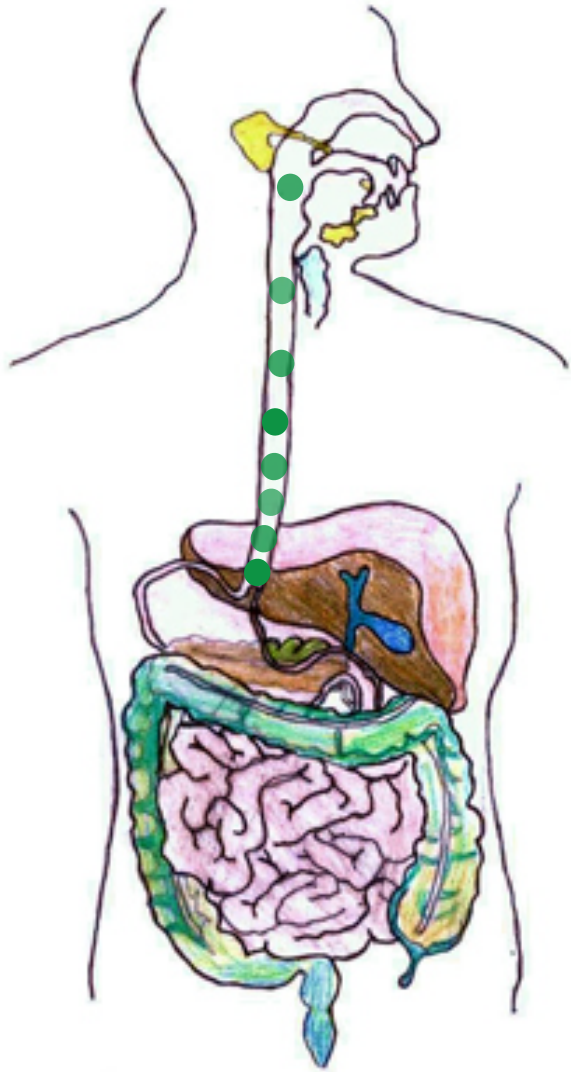

Based on the predictive usage of biomods in the movie
'The dark secret of Hendrik Schon'

It is a path breaking invention in the history of technology. It shows you exactly what the antigens do inside your body and also let you control it in the form of a video game.

The idea is to create a pill that contains several nano machines that traverse in an individual's body and are programmed to identify & kill any harmful microorganisms found inside the individual's body.

Apart from killing the viruses inside your body it uses position sensors that are programmed to project the path taken by the nano machines on a screen. It lets the user control the path it takes using video game controlling systems. For eg. Pacman.

Logan Lape - Gizmodo

The capsule consists of –

1. Virus detector,
2. Antigens,
3. Position sensor
4. Kinect sensor

The pack will come with a mini sd card that can be inserted in any gaming device. (mobile phone, play station, xbox, Tv, Pc, laptop etc)

1. Once the pill is inside the body, the machines immediately become active.

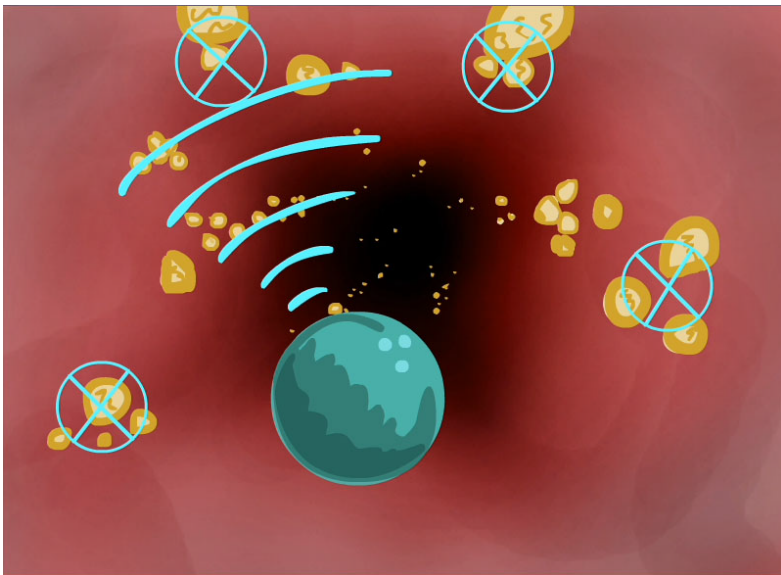

2. So does the screen of your device.

3. The machine identifies the virus

4. It senses the position of the virus which is represented on your screen as an animated villain.

5. Then the antigens are represented as a heroic character on the screen. These antigens are also programmed for manual control.

6. The user can direct the course of the antigens and kill the viruses shown on the screen like in a videogame.

7. Once all the villains (foreign bodies) are killed and the game is over, the nano machines dissolve and the remains come out as faeces.
